

How FrameWorks actually works

Storage, security, and speed — built to scale, not to cap out.

Storage, security, and speed

- **No capacity ceiling**
R2 storage is billed per gigabyte actually used, not carved out of a fixed-size plan up front — a club can upload a full season's worth of RAW files without hitting a wall.
- **Zero egress fees**
Downloading a season's worth of photos back out is free of bandwidth charges — the exact usage pattern that gets expensive on most cloud storage.
- **Metadata-first, not AI-first**
Reads industry-standard IPTC tags photographers already write. No biometric processing, no facial recognition, no GDPR Article 9 exposure.
- **Granular access control**
Custom roles and per-album permissions — a media team decides exactly who sees which team's photos, not an all-or-nothing share link.
